Enterprise Architecture Business Process Model of AB Volvo

- AB Volvo is an intercontinental manufacturer of trucks, buses, construction equipment, and marine & industrial engines. This company provides commercial transport solutions. This company also offers solutions for financing and services to its customers. This company proliferated on many continents.
- The process which I have chosen from the core diagram is the production of construction types of equipment.
- Steps involved in developing a product:
 - At first, customers describe their needs to a company for the desired product.
 - Later, the employee team analyses and gathers all the requirements for developing a product.
 - Provides a model for the desired product.
 - The unit manager approves or rejects by evaluating the model based on the needs of the customer.
 - If the product meets all the requirements, then it moves to the production unit.
 - They manufacture the product and test the product to check if the product meets all the requirements of the customer and works properly.
 - If the product works properly then it is delivered to the customer.
 - Later he tests the product and checks if he is satisfied with the product.
 - If a customer is satisfied then they give bulk orders, if he is not satisfied he denies the product and again process starts from the beginning stage to develop a refined product.
